Osteoconductive

Osteoinductive

Osteogenic

Pre-demineralized for immediate access to growth factors

No harvesting necessary

 While autograft has the advantage of being osteogenic, allograft is demineralized before it is placed into the surgery site allowing for immediate access to growth factors. This offsets the advantage of osteogenicity and helps to make allograft as effective as autograft.^{1,5,6}

 Not having to procure autograft reduces your surgery time and cost. And you avoid the potential morbidity associated with autograft procurement.⁴ Because allograft is as effective as autograft and makes graft harvest unnecessary, allograft is the grafting option of choice.^{1,5,6}
